

Unified Project Management Ecosystem

Technical Overview of the Assign-Project & MyAndroidApp Integration

Repository 1: Assign-project
Repository 2: MyAndroidApp

Bridging Management and Execution

The Command Center

The Managing Director (Web):

Initiates workflows, pushes project data, and tests API integrations via a dedicated web application.

The Field Tool

The Employee (Mobile): Receives assignments, manages statuses, and executes tasks via a secure Flutter mobile application.

The Core Architecture: One unified system spanning two distinct codebases, relying on a single, synchronized database.

The Foundational Tech Stack

Flutter / Dart | EJS / HTML

Top Layer (Client Interfaces):

The physical touchpoints for the MD and the Employee.

Node.js & Express | Apex

Middle Layer (Logic & Middleware):

Handles API routing, business logic, and security handoffs.

PostgreSQL

Base Layer (Data): The single source of truth for user credentials and project states.

Repository Alignment: Web vs. Mobile

Dimension	Assign-project (Web App)	MyAndroidApp (Mobile App)
Primary User	Managing Director (MD)	Employee
Core Function	Assignment Creation & API Testing	Project Status Updating & Execution
Tech Foundation	Apex (89.1%), JavaScript (6.9%), EJS (3.1%)	Flutter, Dart (30.8%), C++ (34.4%), CMake
Form Factor	Desktop Web Environment	Cross-Platform Mobile Client

The MD Perspective: Assign-Project Web App

Primary Role

Serves as the origin point for project data and the primary testing ground for the mobile API.

Architecture Details

Utilizes an `app.js` entry point with a structured directory containing views, public, and `.sfdx` components.

Recent Security Upgrades

Backend dependencies recently migrated from standard `bcrypt` to `bcryptjs` for optimized password hashing and environment compatibility.

The Employee Perspective: MyAndroidApp

Primary Role

Provides a secure, dynamic interface for employees to interact with assigned tasks in the field.

Built-in Resilience

Features robust error handling for invalid credentials or server outages, accompanied by dynamic loading states.

UI Capabilities

End-to-end email and password validation natively handled before API transmission.

The Secure Authentication Bridge

The Project Assignment Lifecycle

Functional Codebase Architecture

Node.js Backend / Assign-project

Flutter Client / MyAndroidApp

The Connected Ecosystem in Motion

Takeaway: Two independent repositories operating flawlessly as one unified project management lifecycle.
